Partners 2023

Nordic Transportpolitical Network (NTN) is a regional transport policy cooperation that has existed since 1998. Partners in the network are regions/county councils with common interests in efficient and sustainable connections between the regions and between the western Scandinavia and Central Europe. NTN is aiming to create the basis for transport policy decisions and qualifying regional planning of transport and infrastructure. The overall vision is developing transport and infrastructure in effective and sustainable way to create regional development. Participants in NTN are 2 Norwegian county councils and three Danish regions.

Regions participating in the NTN cooperation:

CONTAINER TERMINAL

Trends

Transport statistics 2023 Western Scandinavia contains several key figures for the overall infrastructure as well as the development in passenger and freight transport. There is a particular focus on international transport and on the development of traffic in the international corridors.

The statistics contain figures for the most recent year where figures have been published, 2021 or 2022, as well as the development in traffic over several years. Where it has been possible, the development of the past 10 years has been highlighted.

Overall, the statistics show, that there was growth in international freight and passenger transport from 2012 to 2019.

Passenger transport

In 2020 and 2021, COVID-19 had a major impact on the development of mobility and international passenger transport. From 2019 to 2020, there has been a decrease in international passenger transport by ship, train, car and plane. For example, the number of air passengers at the airports in the region fell by between 28 and 76% from 2019 to 2020, the number of passengers at the airports remained at the same low level in 2021 as in 2020. In 2022, the total passenger traffic at the airports in the statistics was approx. 20% below the level in 2019. There is a significant difference between individual airports in Western Scandinavia.

There was also a decline in national passenger transport, although not of the same magnitude as international travel. The decrease in passenger transport by car was almost 10% from 2019 to 2020, from 2020 to 2022 road traffic has grown and is now back at the level of 2019.

The number of journeys by public transport was reduced by approx. 40% from 2019 to 2020, in 2021 public transport was still at the same low level as in 2020. When it comes to the development from 2021 to 2022, there is a difference between the countries included in the statistics. Overall, the statistics indicate that the level is still lower than in 2019.

The statistic of passenger transport by bus covers both tourist traffic and public collective transport. In Denmark, the total passenger transport by bus in 2022 was higher than in 2019. It must be assessed that this applies to on-demand travel (tourist traffic), while the number of passengers in regional public transport is still below the level in 2019.

The statistics also show that there have been significant differences in the development both from region to region and between the different means of transport.

Freight transport

International freight transport by truck increased by approx. 30% from 2012 to 2019, from 2019 to 2022 truck traffic in the international corridors has been at the same level. However, there are significant differences between the different corridors.

Freight transport in containers over the ports has increased in Denmark, in Germany there has been a decrease, while turnover over the ports in Sweden and Norway has been at the same level.

Freight transport by air (air cargo) has decreased from 2019 to 2020, although the decrease has been considerably smaller compared to the development in international passenger transport by air. From 2020 to 2022 freight transport by air increased, so that in 2022 it was back at the level of 2019.

The tables and figures in the Transport Statistics 2023 give the reader the opportunity to assess the development of the individual corridors and routes.

notes:

The international ferry corridors in the statistics covers international transport connections over water served by ferry connections. On the Oresund, the international ferry connections is supplemented by the Oresund Bridge.

1) Stena Line's ferry route between Frederikshavn and Oslo is closed in spring 2020. From June 2020, the sailing on DFDS' ferry route between Oslo and Copenhagen has been changed, so that the ferry docks in Frederikshavn both ways. It is not possible to transport goods and travel as a passenger between Frederikshavn and Copenhagen on the route.

2) Data for the routes between Kristiansand-Hirtshals and Helsingør-Helsingborg contain data from all ferry companies' operation here

3) Stena Line's ferry route between Grenaa and Varberg from March 2020 has been replaced by a new ferry route between Grenaa and Halmstad

4) Sailing time summer or winter

5) Other ferry routes include Helsingborg - Travemünde

International freight transport across borders excl. bulk transport. Mill. tonne
The black numbers refer to the table on page 15

							202,2

Note: The calculation assumes in average 1.54 persons per car in cross-border passenger traffic. The figure has not changed during the period the statistics have been compiled, i.e. since 2008. For the period 2012-2014, the Danish Transport Survey, TU, has calculated that the number of people per car on international trips was 1.67, while for national trips in East and West Denmark were calculated 1.26 and 1.29, respectively.

<i>Cross border pasing trucks pr year</i>								
2022	136.973	181.980	1.054.358	752.394	2.340.015	2.219.424	883.492	7.568.636

Figure 1. The development: total cross-border car traffic in 7 "border sections"
 Index 2012 = 100

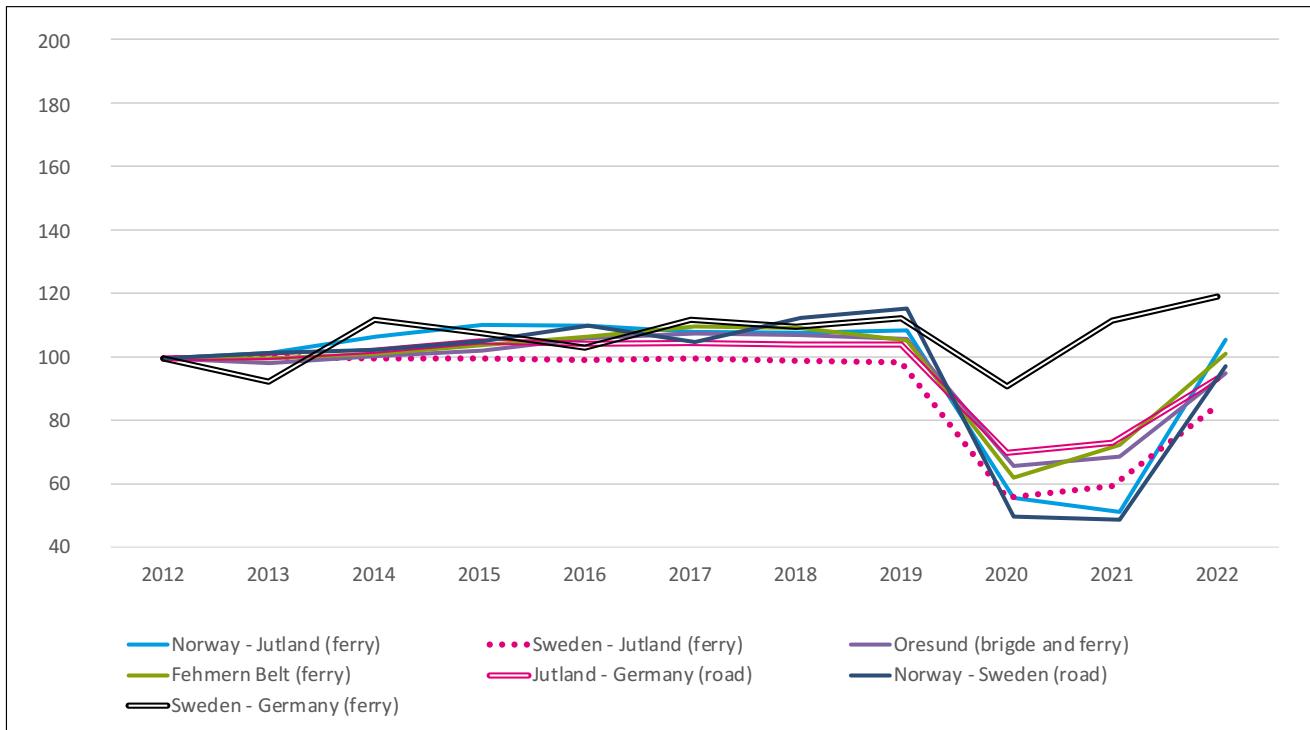

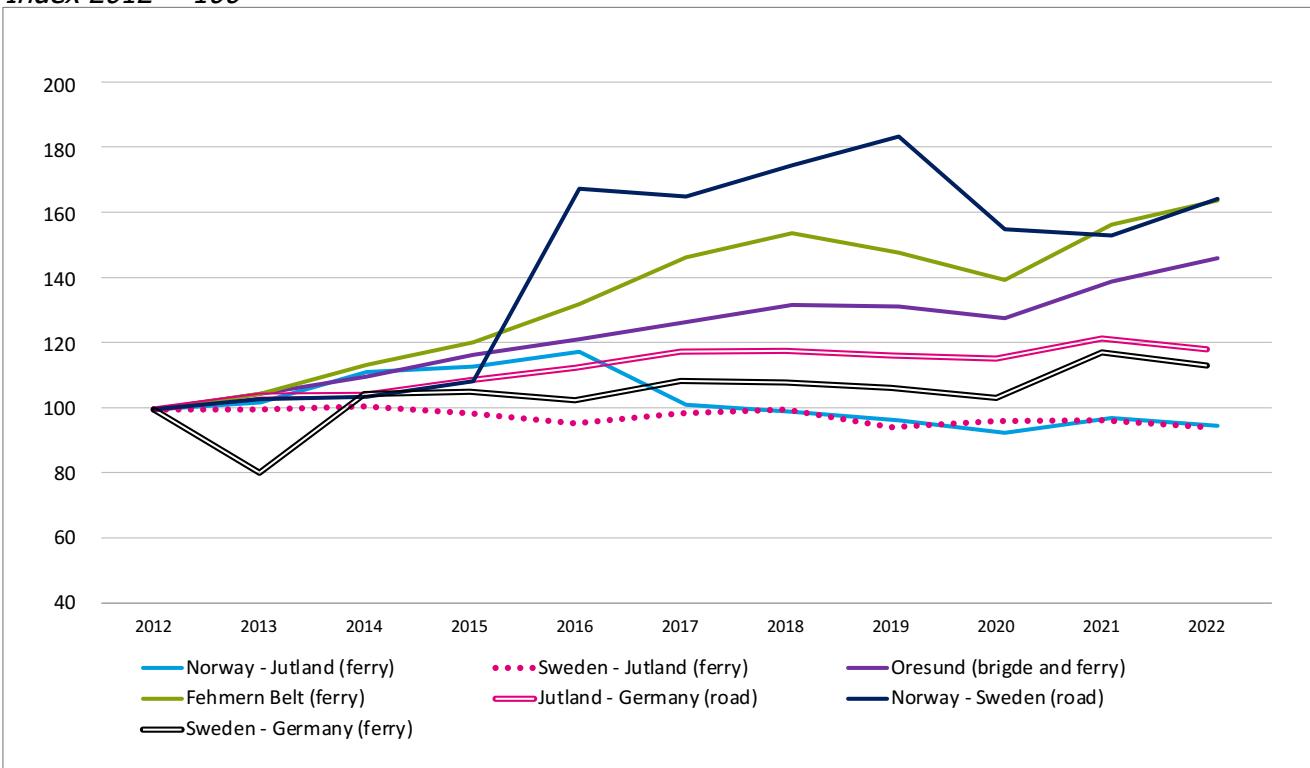

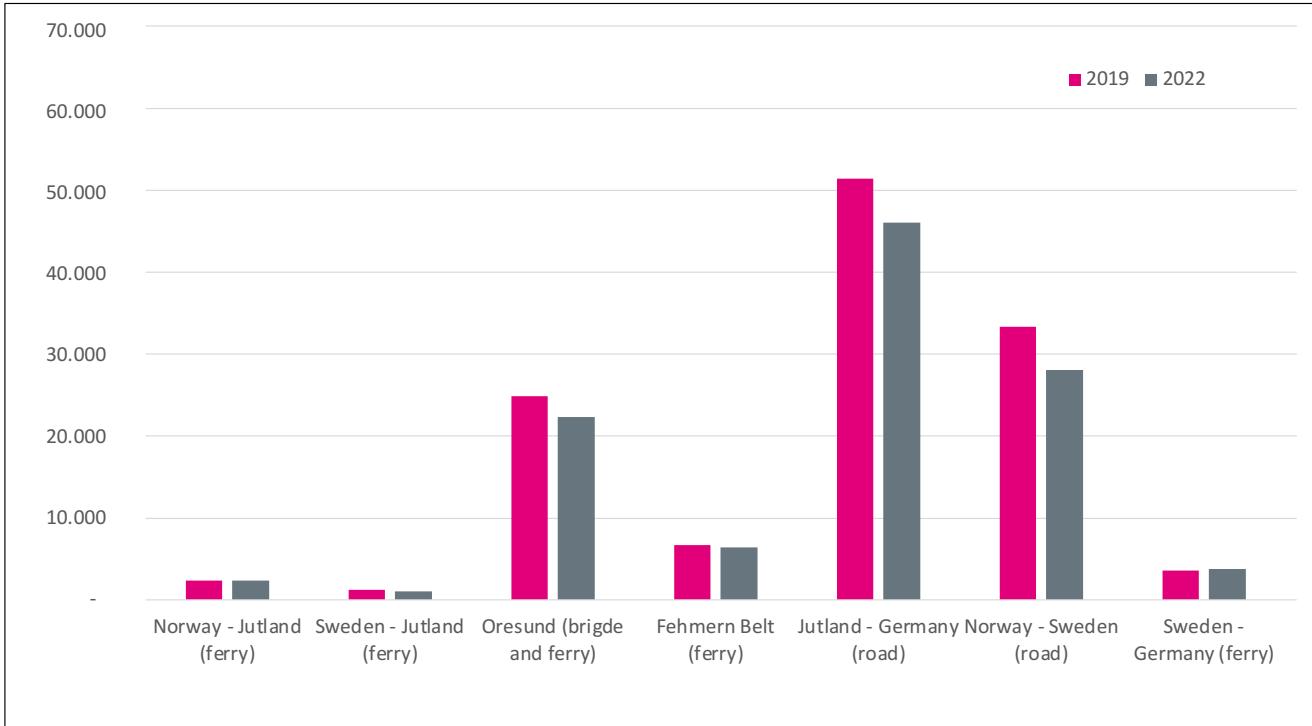

Figure 2. The development: cross-border lorry traffic in 7 "border sections"
 Index 2012 = 100

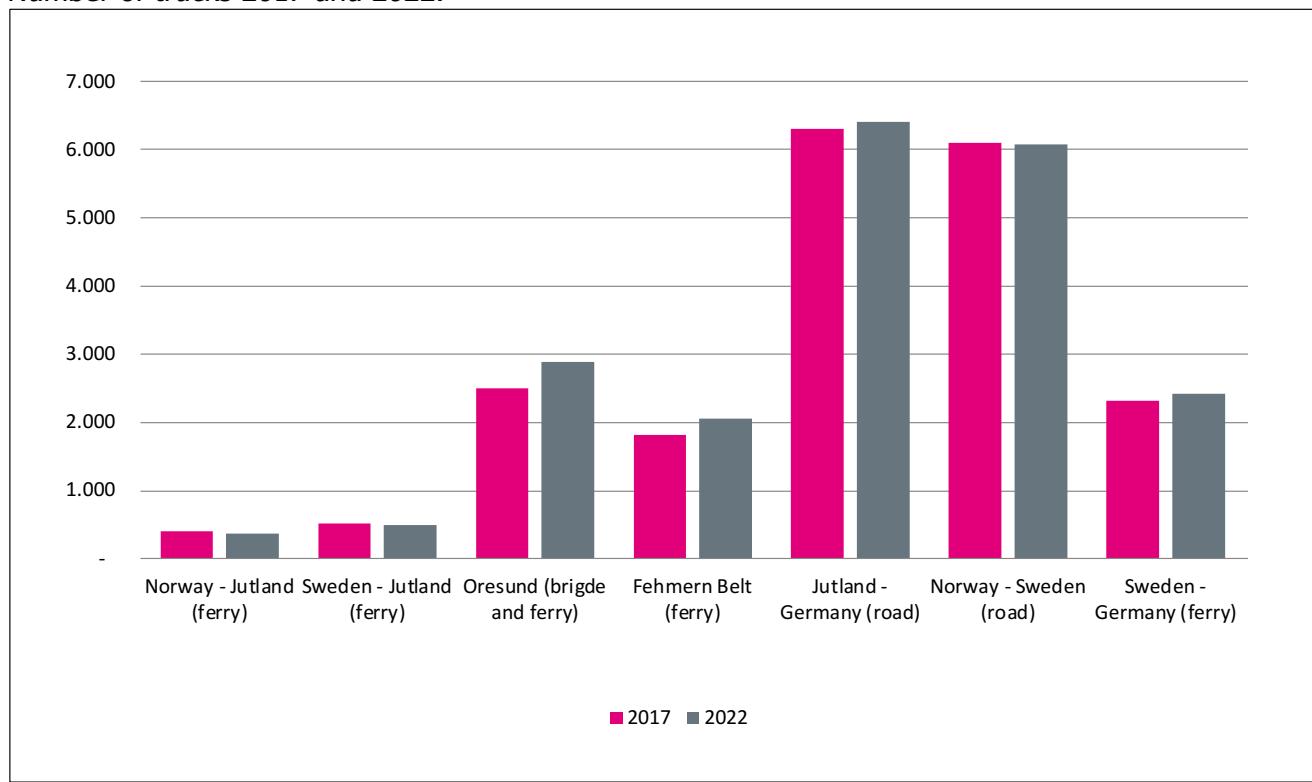

Note: There has been a change in the counting method (lorries) at Nye Svinesund Bridge from 2015 to 2016. This is probably the most important explanation for the development in lorry traffic between Sweden and Norway from 2015 to 2016

*Figure 3. The total cross-border car traffic in 7 "border sections"
Number of cars 2019 and 2022. ADT*

*Figure 4. The cross-border lorry traffic in 7 "border sections"
Number of trucks 2017 and 2022.*

NB: there is not the same scale in the two figures (the difference is a factor of 10)

Roads

Notes:

Due to different administrative divisions, the statistics are not comparable from country to country.

1) Data for Sweden are from 2010

2) Data for Germany includes roads outside cities. Motorways include the "Bundesautobahnen"

3) Other roads in Denmark include the road construction on the Storebæltsbroen

Notes:

Trucks on the road network in Denmark are classified as vehicles over 5.8 metres

NB the time series has been updated in 2020, so that the truck category is now consistently calculated as cars over 5.8 metres.

On the border in Southern Jutland, the Road Directorate has from 2017 calculated the number of trucks on the basis of pattern recognition, this has meant approx. 10% fewer trucks in the counts, therefore the figures for the number of trucks here cannot be compared with previous years.

The ports that serve NTN's West Scandinavian focus area

Note:

Freight transport via Billund Airport is calculated here on the basis of the statistics that the airport publishes on their website. The statistics include goods that are classified as aircargo at the airport.

For the other airports, the calculation is based on the national statistics administrations, in Denmark, for example, Statistics Denmark.

Note:

Note that ore transport is included in both the Swedish and Norwegian statistics. However, they are handled differently in the two statistics:

- In Norway, transport with ore and other products extracted by mining is calculated as an independent product group
- In Sweden, transport on the Swedish part of the Malmbanan is calculated separately

Therefore, the two statistics cannot be 100% compared. However, they both give a picture of the importance of transporting raw materials from mining in the two countries.

I alt	1.135,6	1.162,0	1.168,7	921,9	926,2		100,0%	-1,7%

Note: In Sweden, there is a data breach from 2017 to 2018 due to changed methods for calculating passenger transport work by car and bicycle/walking. For the transport work by car, the change has meant that the calculation of the passenger transport work has been adjusted down by approx. 17%. International trips by plane to and from Swedish airports are included in the national passenger transport work from 2018.

Figure 12. The development in passenger transport work per person per year in Norway, Denmark, Germany and Sweden from 2012 to 2022 (NB national level).

1000 km per person per year

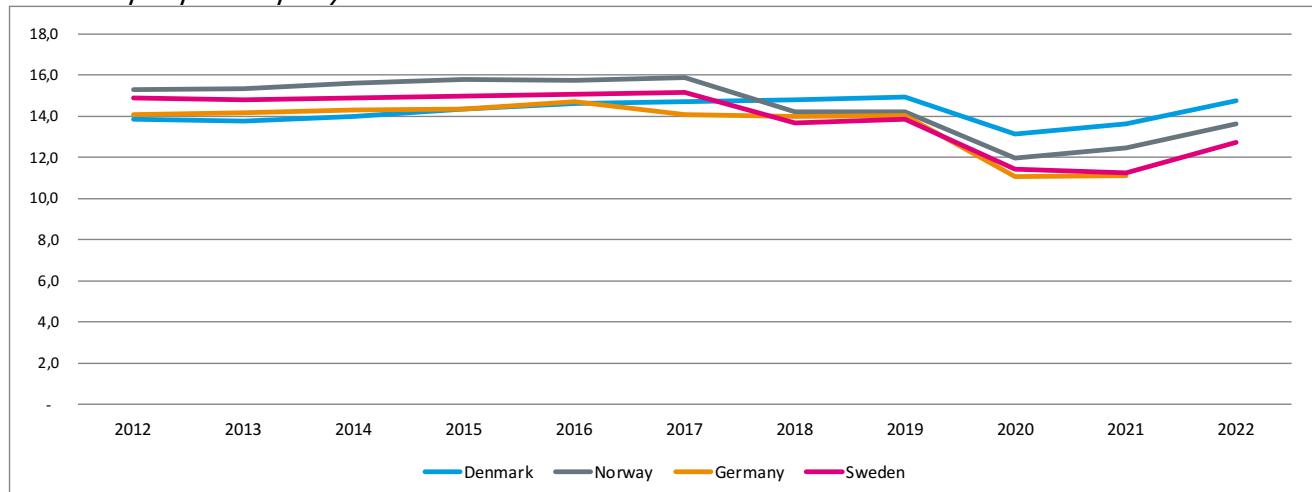

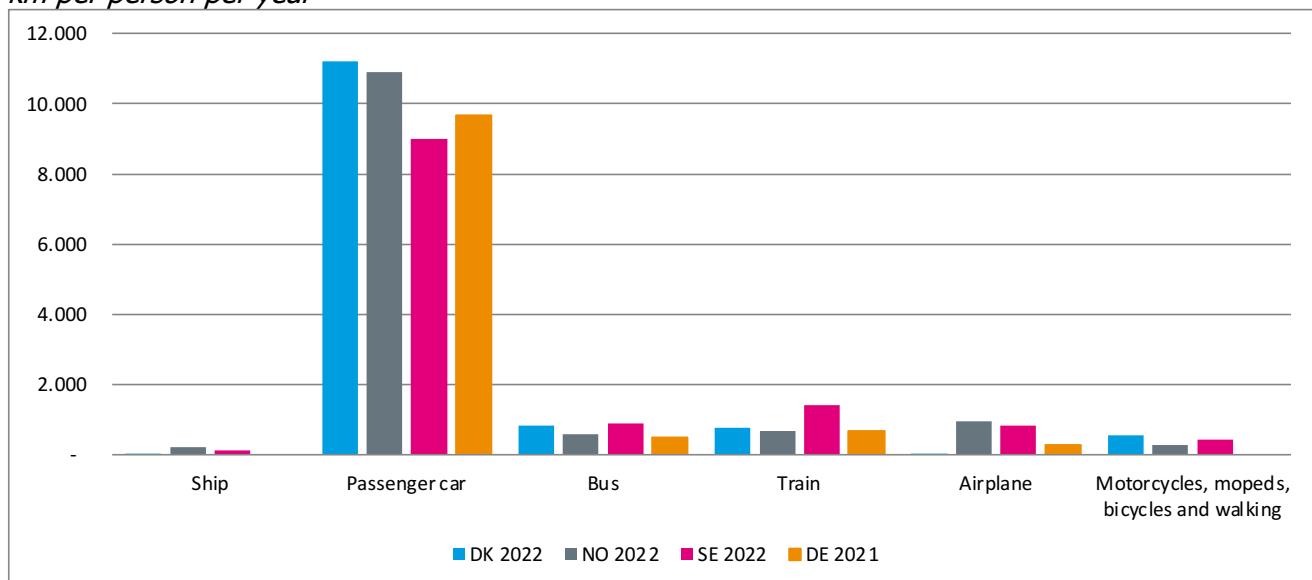

Figure 13. Person kilometers per inhabitant distributed by means of transport in Norway, Denmark, Germany and Sweden (NB national level - NB latest year with data).

km per person per year

Note:

There is a difference in which means of transport are included in the calculation of passenger transport work from country to country. In Sweden, passenger transport work is calculated by walking, cycling, moped and motorbike. In Denmark, the calculation does not include passenger transport work on foot. In Norway, passenger transport work such as walking and cycling is not included in the calculation. In Germany, passenger transport work with motorbikes and mopeds is included under "passenger car", and passenger transport work by bus here includes all local public transport (ÖPNV) as well as on-demand driving by bus.

Landings of fish

Note:

1) The statistics have changed from 2020, for Vestland this has also meant a changed division into municipalities. Therefore, the statistics are not comparable with previous years for Western Norway

2) In Norway, the statistics show the distribution of the country's catch by municipalities

Explanation of words

Passenger transport work

Passenger transport work is the measure of the travel activity carried out by people in a region over a period of time.

Passenger transport work is measured as the total journey length of all persons in the region during the period.

Passenger transport work is calculated as passenger-kilometers.

Passenger kilometers

1 passenger kilometer is the transport work a person has completed when a kilometer has been traveled.

AADT (Annual Average Daily Traffic)

Average daily traffic on a roadway link for all days of the week during a period of one year, expressed in vpd (vehicles per day).

RO-RO traffic

RoRo (English acronym: roll on – roll off) is a term for a type of ship that has a design where rolling cargo can be driven from the quay and directly on board and out of the ship again. When it comes to freight transport, Ro-Ro covers goods on loose trailers that are pulled on and off the ferry, and goods on trucks, where the driver also drives on board.

Bulk transport

Bulk transports include those transports of goods by ship that are not handled in "unit load carriers" but are loaded and loaded directly onto the ship (e.g. oil, coal, timber, stone and feed)
